

The gutter between columns is found by merging text intervals per band. Every decision here is deterministic, offline, and free of model calls. Every decision here is deterministic, offline, and free of model calls. The gutter between columns is found by merging text intervals per band.

Layout is measured per horizontal band, not from the page as a whole. The probe reads the file header instead of trusting the extension. The gutter between columns is found by merging text intervals per band. Every decision here is deterministic, offline, and free of model calls. A single reference page must not outvote multi-column body pages.

The probe reads the file header instead of trusting the extension. A converter that ignores page geometry will interleave columns of text. Every decision here is deterministic, offline, and free of model calls. A scanned page carries no text layer and must be rendered as an image. The probe reads the file header instead of trusting the extension.

The gutter between columns is found by merging text intervals per band. The correct pipeline for a two-column paper is the layout-aware one. A single reference page must not outvote multi-column body pages.

Superscripts, italics and headings survive a layout-aware conversion. Magic bytes are authoritative because extensions are frequently wrong. Every decision here is deterministic, offline, and free of model calls.

The correct pipeline for a two-column paper is the layout-aware one. Superscripts, italics and headings survive a layout-aware conversion. A single reference page must not outvote multi-column body pages. The probe reads the file header instead of trusting the extension. Superscripts, italics and headings survive a layout-aware conversion.

The gutter between columns is found by merging text intervals per band. A converter that ignores page geometry will interleave columns of text. Document routing decides which extraction pipeline a file deserves.

Layout is measured per horizontal band, not from the page as a whole. Layout is measured per horizontal band, not from the page as a whole. Superscripts, italics and headings survive a layout-aware conversion.

Every decision here is deterministic, offline, and free of model calls. Structure is lost when a layout-aware reader is replaced by a naive one. Every decision here is deterministic, offline, and free of model calls.

Layout is measured per horizontal band, not from the page as a whole. The gutter between columns is found by merging text intervals per band. Layout is measured per horizontal band, not from the page as a whole. A single reference page must not outvote multi-column body pages. A scanned page carries no text layer and must be rendered as an image.

Document routing decides which extraction pipeline a file deserves. A single reference page must not outvote multi-column body pages. A converter that ignores page geometry will interleave columns of text. Every decision here is deterministic, offline, and free of model calls.

A scanned page carries no text layer and must be rendered as an image. Magic bytes are authoritative because extensions are frequently wrong. The gutter between columns is found by merging text intervals per band. A converter that ignores page geometry will interleave columns of text. The correct pipeline for a two-column paper is the layout-aware one.
